

ESCAPE-NET DATA DICTIONARY - LONGITUDINAL COHORTS

The ESCAPE-NET data harmonization effort allows us to combine heterogeneous data sets from the involved project sites in order to carry out subsequent pooled analyses.

The two interconnected data harmonization committees have created a list of variables (data dictionary) which are common to all cohorts based on clinical relevance and availability, one for the SCA (case) cohorts and another for the longitudinal cohorts.

Before data can be incorporated into the database, data must be transformed according to the ESCAPE-NET variable lists.

Instructions for harmonization responsible

- Transform local variables to the ESCAPE-NET format, according to variable naming, type and coding in this data dictionary.
- Fill in the codebook (<https://escape-net.github.io/docs/documents/documents.html>) with the variables you have transformed to the listed ESCAPE-NET variable, including the local variable name, type, coding, and transformation syntax. The transformation syntax as noted in your codebook should correspond with the “real” transformation syntax used. The codebook is a transformation “recipe”, ensuring that potential sources of heterogeneity between transformed cohorts are elucidated.
- Include a brief description of the method of data collection. If much detailing is needed, a link to a paper describing how the variable was collected or derived is accepted.
- If data is missing, code as follows:
 - a. -3 means 'not applicable'. An example from the case cohorts: a patient suffers an OHCA, with diagnosed cause hypertrophic cardiomyopathy. In that case, a PCI is not applicable, thus code -3.
 - b. -2 means 'not recorded'. It could be that your study does not record this particular data item.
 - c. -1 means 'unknown'. This means that the variable is recorded in your study, is also applicable for this patient, but is missing, for whatever reason.
- Be aware that variables describing dates should be of type numeric (Integer), i.e., MMYYYY (e.g., 082007).
- Be aware that time intervals should be included as seconds and not hh:mm:ss
- Quality check of transformations and information (check by a naive third person) is the responsibility of the local cohort.
- In the end, transformed data should be stored in CSV format with a csv file for each data table (Ic identifiers, Ic basic, Ic medication, etc.).
- Lastly, fill in the Quality Control Checklist for the longitudinal cohorts found here (<https://escape-net.github.io/docs/documents/documents.html>)
- Data can be uploaded to the ESCAPE-NET database with the help of the consortium data manager (simon.mathis.koenig@regionh.dk).

If you have any doubts, please contact Simon Mathis Kønig.

OHCA_DELAY_SYMP	binary variable: 1h/24h last seen in a healthy state	Choice	-3 NA; -2 not recorded; -1 unknown; 1 <1-hour; 2 <24-hours	
RES_WITNES	a witnessed cardiac arrest is one that is seen or heard by another person or an arrest that is monitored	Choice	-3 NA; -2 not recorded; -1 unknown; 0 no; 1 yes; 2 EMS	
RES_NOCPR	EMS personnel may not attempt resuscitation when a do- not-attempt- resuscitation (DNAR) order exists, a resuscitation attempt is considered futile, or resuscitation is not required (e.g., the patient has signs of circulation).	Choice	-3 NA; -2 not recorded; -1 unknown; 1 died earlier; 2 DNAR; 3 wish family; 4 wish doctor; 5 succesful ICD shock; 6 signs of life; 7 CPR attempt by EMS	
RES_BYSTANCPR	Bystander CPR is cardiopulmonary resuscitation performed by a person who is not responding as part of an organized emergency response system to a cardiac arrest. Physicians, nurses, and paramedics may be described as performing bystander CPR if they are not part of the emergency response system involved in the victims resuscitation	Choice	-3 NA; -2 not recorded; -1 unknown; 0 no CPR; 1 any bystander w/o additional information; 2 full CPR; 3 CCO CPR	For the EuReCa ONE study "any bystander-CPR" has been added compared to Utstein definition. Participants should preferably specify between "full CPR" and "CCO CPR"
RES_INIRHYTHM	The first monitored rhythm is the first cardiac rhythm present when the monitor or defibrillator is attached to the patient after a cardiac arrest. If the AED does not have a rhythm display, it may be possible to determine the first monitored rhythm from a data storage card, hard drive, or other device used by the AED to record data. If	Choice	-3 NA; -2 not recorded; -1 unknown; 0 not shockable; 1 shockable	From EMS defib. If AED first: from memory or "shockable" if AED shock given. This data point can be updated at a later time if the AED has data download capability.

	the AED has no data recording device, the first monitored rhythm should be classified simply as shockable or nonshockable.			
RES_AEDSHOCK	When a bystander attempts defibrillation, e.g., public access or lay rescuer defibrillation, it is recorded as a defibrillation attempt before EMS arrival. AEDs are increasingly being made available for access by the general public. In patients with an ICD, a shockable rhythm is likely to have triggered at least one shock by the device before the arrival of EMS personnel. This can be confirmed by analyzing the ICD memory. After extensive discussion, the task force agreed that defibrillation attempts by ICDs are important but difficult for EMS to track. Thus, ICD documentation is optional.	Choice	-3 NA; -2 not recorded; -1 unknown; 0 no; 1 yes	Can be from AED memory or verbal report and EMS info
